

Credit Name: CSE2140 2nd language programming

Assignment Name: GuessingGame, VolumeCalc

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

I broke down what each program needed to do and identified the inputs, calculations, and outputs required. The main challenge was understanding how to handle the different possible inputs and results.

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

How did you decide on the tools, data structures, or algorithms to use?

I planned the main steps before coding by deciding what information the user needed to enter, what calculations or logic were required, and what the program should display.

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

How did you test your solution along the way to make sure it was working?

I built the programs one section at a time and tested each part before continuing. This made it easier to find errors and make sure the programs were working as expected.

Overcoming Challenges

What part of the problem was the most difficult for you?

How did you handle moments when you felt stuck or unsure of what to do next?

The hardest part was getting all of the conditions and calculations to work correctly. I handled this by testing different values and changing the code when the results were not what I expected.

Learning

Was there anything you learned that you think will help you with future challenges?

I learned more about using functions, random numbers, conditional statements, and mathematical formulas in Java. These skills will help me when creating more complicated programs in the future.
