

Credit Name: CSE2140 2nd language programming

Assignment Name: CompoundInterest, Change

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

I broke down what each program needed to calculate and what inputs were required. The most confusing part was making sure invalid inputs were handled correctly.

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

How did you decide on the tools, data structures, or algorithms to use?

I planned the inputs, calculations, and output before coding. I used Scanner for input and a GetNumber function to reuse my input validation.

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

How did you test your solution along the way to make sure it was working?

I built the programs in smaller sections and tested them as I went. I tested both valid and invalid inputs.

Overcoming Challenges

What part of the problem was the most difficult for you?

How did you handle moments when you felt stuck or unsure of what to do next?

The hardest part was input validation. I used try-catch and loops to prevent the program from crashing when invalid input was entered.

Learning

Was there anything you learned that you think will help you with future challenges?

I learned how to validate user input and use functions to avoid repeating code. These skills will help me make more reliable programs in the future.
